Branch: fix/property-system-review

Base commit: e69dcba (merge of PR #13)

Objective

Create a channel-neutral and vendor-neutral property-system integration boundary, exposed as an OpenAPI HTTP contract implemented and maintained with FastAPI and canonical Pydantic v2 schemas.

Delivered

- Added PropertySystemPort for property facts, live availability, and reservation reads.
- Added Pydantic v2 schemas for facts, availability, prices, reservations, and API principals.
- Added versioned FastAPI routes under /v1/property-system.
- Published OpenAPI 3 at /openapi.json, Swagger UI at /docs, and ReDoc at /redoc.
- Added stable operation IDs for generated clients: getPropertyFacts, checkPropertyAvailability, and getReservation.
- Published the PropertySystemApiKey OpenAPI security scheme using X-API-Key.
- Enforced server-side tenant resolution and server-resolved identity verification.
- Mapped authentication, authorization, missing-data, and upstream failures to 401, 403, 404, and 503 responses.
- Added tests for OpenAPI metadata, tenant isolation, live availability, failure behavior, identity gating, schema validation, and application configuration.
- Added the delivery specification at docs/specs/open-property-system-api.md.

Architecture

External platforms integrate through the OpenAPI 3 HTTP contract. FastAPI is the maintained Python implementation. Pydantic v2 models remain the schema source of truth. FastAPI delegates domain reads through PropertySystemPort, keeping channel and property-vendor SDKs outside the core.

Commits

- 5654ff4 ? Add the vendor-neutral property-system port, schemas, router, tests, and specification.
- 6bb106d ? Harden tenant and identity authorization and validate configuration/date invariants.
- 88456ac ? Publish the versioned FastAPI/OpenAPI contract, security metadata, documentation UIs, stable operation IDs, and documented responses.

Verification

- Ruff lint and targeted formatting passed.
- Strict mypy checks passed for the new and modified modules.
- Focused domain, intent, and eval tests passed: 86 tests.

- Recorded classifier eval gate passed at the existing 87.5% baseline.
- Programmatic OpenAPI generation produced OpenAPI 3.1.0 with five paths and verified the API-key security scheme and stable operation IDs.

Repository state

The work is committed locally on fix/property-system-review. The working tree was clean when this summary was generated. Earlier push attempts were blocked by the environment's GitHub HTTPS tunnel, so the branch may still need to be pushed before opening the pull request.
